

GMF has a quality management system as a tool for a steady improvement in order to achieve its strategic goals and, in this way, strengthen its position in the railway market. The managing direction has carried out a complete compendium on organization framework, has identified the needs and forecasts of the involved stakeholders and, in the same time, has undertaken an analysis on risks derived from its business activity in order to achieve the customers' satisfaction.

Its management system has been based on the UNE-EN-ISO 9001 international regulation, the 445/2011 European rule and other railway precepts in force. In this sense, this regulation has been adjusted in order to improve the management efficiency and, consequently, obtain the necessary benefits for its clients and the organization.

The services provided by GMF are:

- Rental and control of railway machinery production for railway renewal and construction works as well as train transport by including its maintenance.
- Maintenance of locomotives, auxiliary rolling stock and wagons including those activities as an entity in charge of the maintenance in the entire scope of responsibilities of the 445/2011 European regulation.
- Production and commercialisation of railway material.
- Production, commercialisation and assembly of mechanical parts and subassemblies for an industrial use.

The GMF activities main goal is, on the one hand, to define and satisfy the customers' requirements in order to meet their needs and expectations by extending this commitment to its collaborators and, on the other hand, to guarantee the compliance of current legal and regulatory requirements.

The staff awareness and participation in this policy as well as the implementation of appropriate methods for GMF processes are aimed at the steady improvement of the quality management system.

As a proof of this commitment, this document is signed in Constantí (Tarragona), on 21<sup>st</sup> December 2017.
